

Asbestos kills.

It's best to test.

Asbestos exposure is the number one cause of work-related deaths in Saskatchewan.

Asbestos can be found in many homes and buildings built before 1990. When disturbed, tiny asbestos fibres are released into the air where they can get into the lungs and cause serious health issues such as lung cancer, asbestosis and mesothelioma.

Before any job – from small repairs to large demolitions:

1

Ask if there is asbestos present

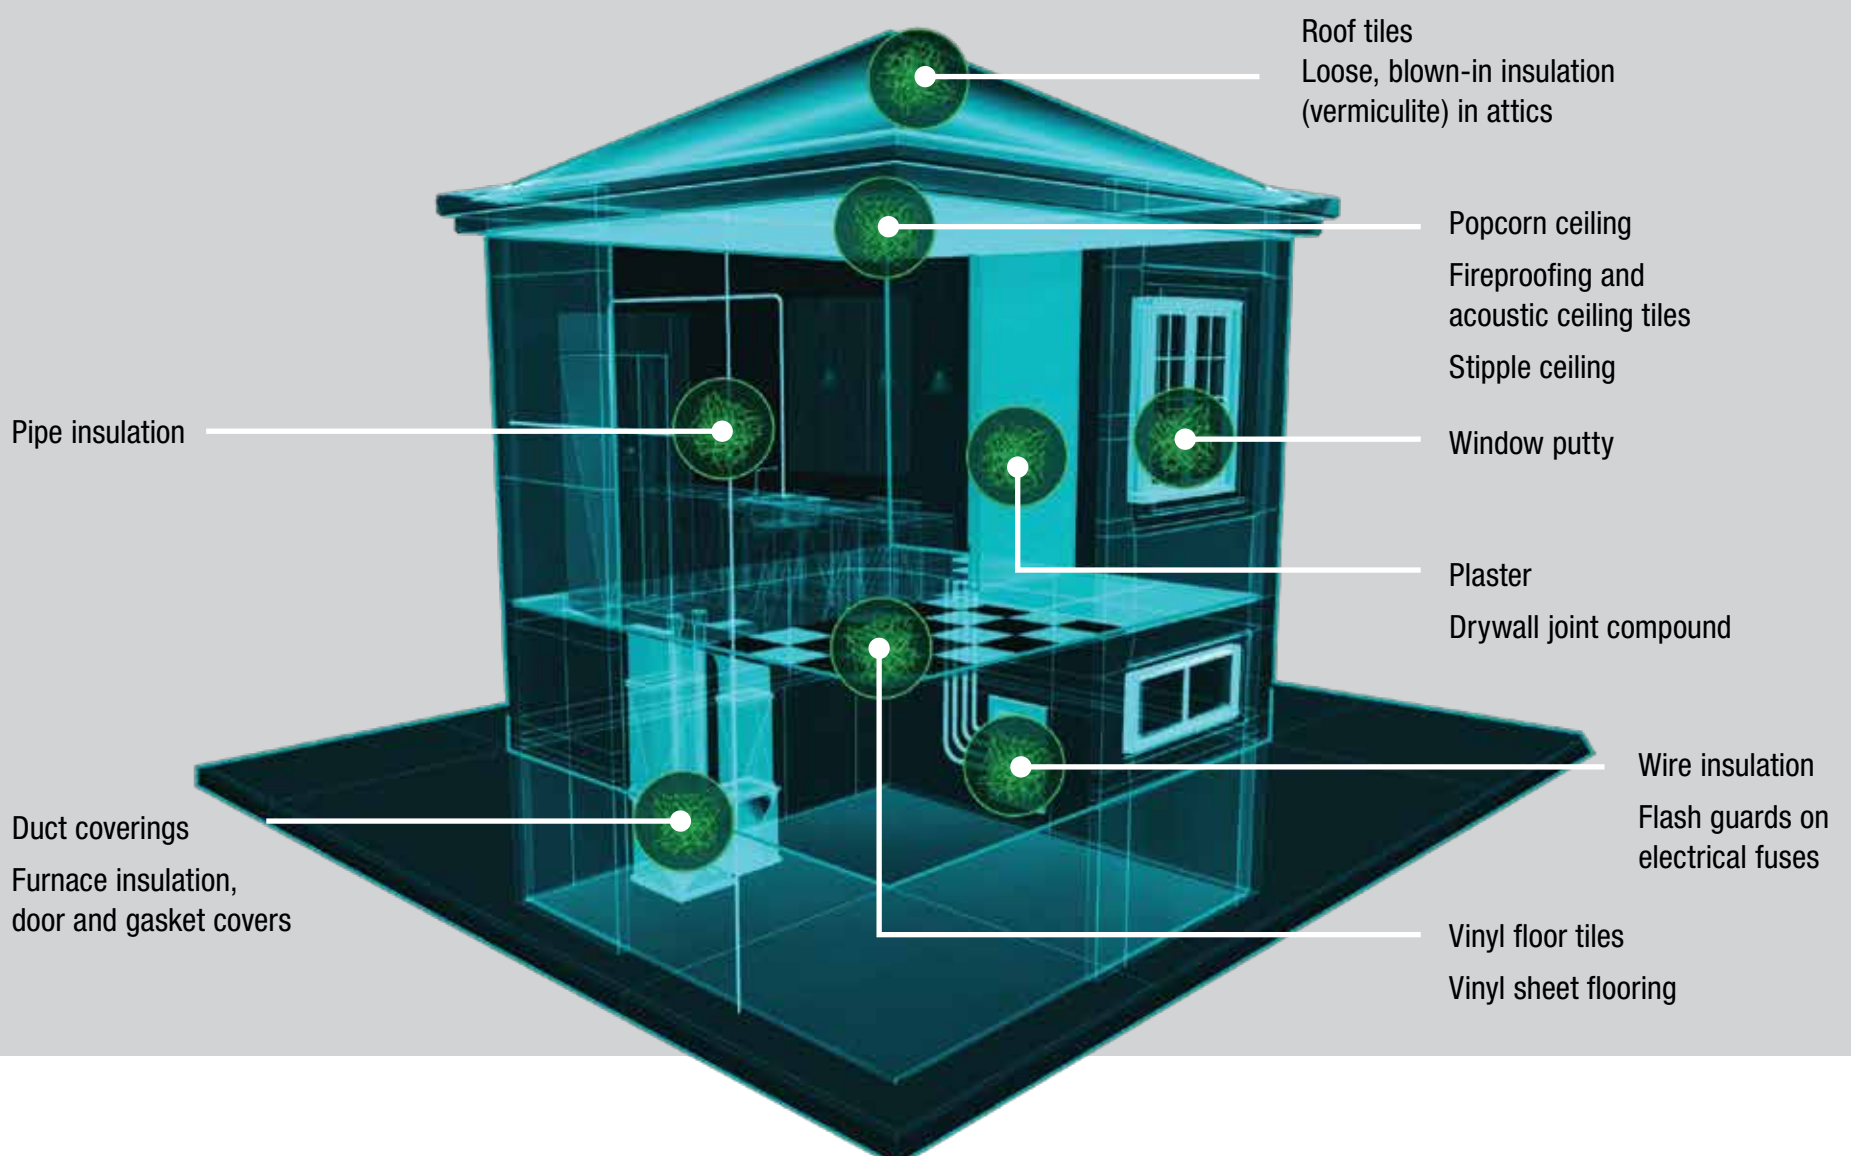

2

Test to be sure

3

If you find asbestos, have it removed or controlled by a qualified asbestos abatement specialist

Do you know where asbestos could be hiding in your house?
